  - (m) The Operator will ensure that the air supply line pressure is set as directed by the Driver.
  - (n) The Operator will monitor the discharge line and storage tank for leaks during unloading.
  - (o) The Driver will terminate unloading by stopping the unloading blower.
  - (p) After all air pressure has been vented from the tanker and storage tank, the Driver will isolate the discharge hose.
  - (q) The Operator will close the transfer line isolation valves.
  - (r) The Driver will disconnect the air and liquid lines ensuring that any drips are collected in the containment vessel.
  - (s) In the event that a tank high level alarm occurs during unloading, a high level warning alarm light and horn will occur at the liquid ferric unloading station. If this occurs, the transfer should be stopped immediately until the problem can be corrected. If the problem(s) can be rectified, the isolation valves can be re-opened by the Operator and unloading continued.
